Your system will restart and take you to the BIOS.

Windows 10 gives you a lot of options you can configure directly within the operating system, but on every computer, there are some settings you can only change in the BIOS (basic input / output system). The BIOS is the software that is built into your computer's motherboard and controls everything from the boot order of your drives to preboot security options to whether the Fn key on your keyboard activates a function key or a media control. Unfortunately, because the BIOS is a pre-boot environment, you can't access it directly from within Windows.
